#####
##### Shiny App for Species Annual Temporal Abundance Models #####
#####

# First the user needs to upload the data csv file into the application and
# then select whether normalize the numerical predictors or not.
# The data file should include only:
#     Year - Detected Year
#     Count - Species count
#     with or without predictor variables (numeric/factor).
# The above names are case sensitive.
# User can include any number of factor or numeric variables.
# Predictor variables should include as character or factor variables.
# A sample format of the data can be found in https://github.com/uwijewardhana/UDMTA.
# Data should be ordered according to factor levels and Year as in sample "Data.csv".

### Shiny User Interface ###
